

There is nothing worse than a drain backflow. Cleaning and repairing the damage caused by sewer water can be very costly. That's why we offer these devices to help prevent drain backflow.

The **Float Model** is essentially a check valve for your floor drain. The water will exert pressure on a rubber float. When pushed enough, the rubber float will seal your drain, protecting your home or business from flooding. This model is offered in 2", 3", and 3" drain sizes.

The **3" Standpipe Model** has a rubber gasket that the standpipe is inserted into and both are then lowered into the drain pipe. The screws are fully tightened once it has been lowered inside the drain pipe to ensure a tight seal. The rubber gasket will receive 1-½" PVC, ABS, galvanized or other iron pipe sized piping like stainless steel or brass. The standpipe must not have an outside diameter greater than 2".

The **4" Standpipe Model** is threaded, and takes 1-½" IPS pipe, galvanized, stainless steel, brass and ABS or PVC male adapters. The standpipe can be connected before or after the Drain Flood Protector's screws are tightened into the drain.
